Expanding Treatment Options for Severe Brain Trauma

Every 15 seconds someone in the United States suffers a traumatic brain injury; a new research study at UC San Diego Health seeks to improve treatment options

Hyperbaric oxygen therapy involves breathing pure oxygen in a pressurized room or tube, and is commonly used to treat decompression sickness resulting from scuba diving or wounds that resist healing, such as those resulting from some types of cancer radiation treatment or from complications

of diabetes. Researchers at UC San Diego Health have joined a national research study called Hyperbaric Oxygen Brain Injury Treatment (HOBIT) to assess whether the approach might also benefit patients with severe brain injuries.

“Trauma can be a devastating injury that will greatly affect a person’s quality of life, and we are looking to improve treatment options in order to significantly increase positive outcomes for our patients,” said Dr. Todd Costantini, trauma medical director at UC San Diego Health and the site principal investigator for the HOBIT study. “This is the first randomized, controlled trial analyzing the effects that hyperbaric oxygen treatment has on outcomes following brain injury, and preliminary studies have demonstrated that it may improve neurological recovery.”

The idea is to use oxygen under pressure to reduce brain swelling and oxygenate neurological tissues, reducing or replacing the inflammatory response with a restorative one. Patients rest in a hyperbaric oxygen chamber equivalent in size to a small school bus for approximately two hours during which they inhale 100 percent oxygen for approximately 90 minutes. Study participants receive up to 10 treatments, occurring twice a day, for five days. Specific treatments will involve different pressurizations, randomly selected, and include a control group.

“Out of all the kinds of treatments we provide, hyperbaric oxygen therapy is one of the safest and best tolerated,” said Dr. Ian Grover, medical director of Hyperbaric Medicine and Wound Care at UC San Diego Health. “With head trauma, the brain cannot get enough oxygen, which worsens the healing response, but with this treatment, we’ll be able to increase oxygen delivery and we believe the benefits for patients will be seen almost immediately.”

The clinical research study is part of the Strategies to Innovate Emergency Care Clinical Trials Network, otherwise known as SIREN, which seeks to improve the outcomes of patients with brain, heart, lung and trauma emergencies by identifying effective treatments administered in the earliest stages of critical care. Approximately 14 hospitals nationwide will participate in the HOBIT study, including UC San Diego Medical Center in Hillcrest.

HOBIT must be provided quickly, said researchers, and because of this, persons in San Diego who experience severe brain trauma may be taken to UC San Diego Health and enrolled in the trial without informed consent.

UC San Diego Health physicians are collaborating with the U.S. Food and Drug Administration (FDA) to qualify for Exception from Informed Consent (EFIC) by alerting the community of the study. EFIC grants approval for certain emergency research studies to be conducted under a special set of rules managed by the FDA when participants cannot express their desires in a medical emergency.

“Patients involved in this study are cared for by a multidisciplinary team of trauma surgeons, neurosurgeons, hyperbaric medicine physicians and nurses,” said Costantini. “Our role as the region’s only academic health system provides us with the opportunity to advance the field of trauma and

continue to enhance the level of care our patients receive. Like any study, there is a safety and monitoring board to review the trial and patients enrolled to ensure safety, as well as mitigate any unforeseen risk.”

The [Hyperbaric Medicine and Wound Care program](#) at UC San Diego Health is among the largest and most sophisticated in California. It has been in operation for 34 years.

For more information on the HOBIT study, to provide input through in an anonymous survey or to choose to automatically opt out in the case of an emergency, visit health.ucsd.edu/trauma-research or contact the research team at 619-543-7218.

Funding for this study came, in part, from the National Institute of Neurologic Disorders and Stroke (grant 11925977).
