

## Construction has begun on temporary building of UCLJ campus

**August 25, 1960**

Construction has begun on a new temporary building on the southern edge of The University of California campus at La Jolla. The building, to be used as a machine shop, is required by the expansion of the program of the School of Science and Engineering. The slab has already been laid and girders will be delivered soon.

"Erection of the new building is one thing that is making it possible to start the School of Science and Engineering before its own building is constructed," J. W. Tippetts, campus Building Program Coordinator says. The School is expected to move into new quarters on the mesa adjoining the Scripps Institution of Oceanography in the summer of 1962. Meanwhile, it is being housed in Scripps building.

The 7,000-square-foot new building will be a prefabricated metal structure. The already overtaxed facilities of the present Scripps machine shop cannot cope with the needs of the new School's experimental program in physics and chemistry, Tippetts says.

The one story building will have a low pitched roof. It will be painted to blend with other structures on the campus. It should be ready for occupancy by late fall.

A prefabricated building was selected for the site because later it can be dismantled and moved to another location as campus expansion demands it, Tippetts said. It is not a part of the master plan of the campus.
