Description of materials: This memorandum from G. F. ENGLE was found with a letter from ED. HYATT of JULY 7, 1944 to Cal. Fish & Game Commission

Removed to: HYATT CORRESPONDENCE SERIES under HYATT

Processor: C. McCURKAN Date of Removal: APRIL, 1991

Re: Proposed Dams on Cedar Creek,  
San Diego County  
Inspected June 20, 1944  
By G. F. Engle

In accordance with your teletyped instructions the writer has made a preliminary inspection of the sites for three proposed dams on Cedar Creek, in company with Senator Ed Fletcher, Mr. Fred D. Pyle, Hydraulic Engineer for the City of San Diego and Mr. Carl Johnson, President of the San Diego County Fish and Game Association.

Senator Fletcher proposes to deed the dam and reservoir sites as a gift to the State Fish and Game Commission, with the stipulation that the dams be actually constructed and reservoirs created and dedicated to the use of the public for sporting and recreational purposes, an outline of his proposal is set forth in a memorandum to the writer, which is as follows:

"Confirming our conversation yesterday in inspecting the Cedar Creek damsites, will say:

"If we can agree on the location of the three damsites, it is the intention of this company to deed the damsites and the reservoir sites, free of any costs, to the State, also, at least a fifty-foot roadway around each of the reservoir sites, all to be dedicated to the public, connecting the three reservoirs."

"We will furnish a certificate of title and policy of insurance showing the property is free and clear of encumbrances as of the date of completing the contract."

"All we are asking in return, as the only consideration, is that the State of California, or any other governmental agency,

build the dams without expense to us and the lakes are to be used primarily for sporting and recreational purposes.

"It is understood that the maintenance of these dams, once constructed, is wholly a State matter, under the supervision of the Fish and Game Commission of California or the State or United States Forest Service.

"In the construction of these dams any timber or other materials we have nearby on our private property, necessary for the construction of the dams or the improvements above mentioned, we will be glad to furnish without charge.

"It is stipulated that these three lakes be known as Fletcher Lakes.

"We are willing at any time to put a Deed in escrow, if desired, as an evidence of good faith, or make any other mutually satisfactory arrangements in the form of a contract that will bind the Fish and Game Commission, or other governmental agency, to complete this program within a definite time. All we want is the definite assurance that the work will be completed and if necessary we will deed the property at the time the contract is signed, and put same in escrow.

"We will be glad to cooperate in every way.

Very sincerely yours,

(ED FLETCHER, President)"

The present preliminary investigation has been made in order to determine whether the construction of dams at the sites is feasible and practicable.

The proposed sites are located in a section of Cedar Creek, San Diego County, about  $1\frac{1}{2}$  miles in length, measured along the

stream channel, in the SE $\frac{1}{4}$  of Section 23 and Section 24, Township 13 S R 3 E, as shown on the attached Southern California Chart #2 of the U.S. Geological Survey.

The lower site is situated in the SE $\frac{1}{4}$  of the SE $\frac{1}{4}$  of Section 23, just upstream from a water fall, created by a granite dyke which crosses diagonally with the stream channel. Of the three sites this is the only one at which detailed surveys have been made. Attached hereto are: 1. Plat showing the topography at the damsite, and, 2. Topography of the reservoir with a table of capacities for heights of dam up to 100 feet.

The upper dam is probably not far from the center of Section 24.

The middle dam is probably a little more than half way from the lower and upper sites.

The stretch of canyon on which the sites are located is characterized by extremely narrow bottom width and steep sides; some granite bed rock structure is indicated in the stream channel and by frequent outcroppings on the canyon walls. These characteristics of steep sides and uniform erosion are indicative of a sound and resistent bed rock structure.

The upper site is particularly favorable in that the sound granite bedrock is visible in the surface on both sides of the canyon as well as in the stream channel. The cross section is symmetrically "W" shaped and the crest length for a dam at this site would be small in relation to the height.

The middle site is almost as favorable as the upper site, except that a definite location is not so immediately apparent until some additional investigation is made in order to fix the most economical location within limits of a few hundred feet up and down the

channel.

The lower site is favorable topographically, possessing a uniform and symmetrical cross section as indicated by the attached topographical chart and lying just upstream from a granite dyke which crosses the canyon to create the falls above mentioned.

The right side of the canyon is barren of overburden; the granite bed rock being uniformly visible at the surface.

The left side has a somewhat flatter slope and is covered with a weathered decomposed material, the depth of which above bedrock would have to be determined by test pits or borings.

The three sites are especially favorable in their general preliminary aspects and it is more than probable that any subsequent, further investigation and study which may be made will indicate that dams can be satisfactorily designed and constructed at relatively low cost. The sites appear to be favorable and practicable.

The attached photographs of the middle and upper sites, due to the vegetal covering, do not show much about the characteristics of the entire site.

The selection of the type of dam most favorable for each site will depend upon an additional investigation which should include some survey work in addition to exploration of the adjacent territory for sources of suitable construction materials. For instance, the writer's tentative impression is that an earth type at the middle and upper sites may be eliminated because of lack of suitable earth fill material readily available in the vicinity.

Further consideration of developing the project embracing the three dams and reservoirs, indicates the desirability of a stream channel profile along the stretch of channel in question and detailed topographical surveys of the middle and upper sites; topo-

graphy of reservoir areas need be only in sufficient detail to get a substantially accurate estimate of the storage.

It is probable that surveys necessary to complete the investigation to a point where design of the dams can be made, would cost not more than \$500.00.

In addition, a nominal amount of investigation and exploration work involving test pits and/or borings should be made.

The present preliminary investigation has been predicated upon the assumption that dams of heights in the order of 40 to 60 feet are contemplated.

In summary, it is believed that the preliminary aspects of the three sites are sufficiently favorable to indicate that the construction of safe dams at these sites is feasible and practicable.
